# An alternative proof of a theorem about local newforms for $\operatorname{GSp}(4)$ 

Brooks Roberts *<br>Ralf Schmidt ${ }^{\dagger}$

The work [RS] presents a theory of local new- and oldforms for representations of $\operatorname{GSp}(4, F)$ with trivial central character for $F$ a non-archimedean field of characteristic zero. This theory considers vectors fixed by the paramodular groups $\mathrm{K}\left(\mathfrak{p}^{n}\right)$ as defined in [RS]. Let $(\pi, V)$ be an irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character. One of the main theorems of [RS] asserts that if $V$ contains a non-zero vector fixed by some paramodular group $\mathrm{K}\left(\mathfrak{p}^{n}\right)$, i.e., $\pi$ is paramodular, and $N_{\pi}$ is the smallest such $n$, then the space $V\left(N_{\pi}\right)$ of $\mathrm{K}\left(\mathfrak{p}^{N_{\pi}}\right)$ fixed vectors in $V$ is one-dimensional. If $\pi$ is paramodular, then any non-zero element $V\left(N_{\pi}\right)$ is called a newform. Other theorems of [RS] describe the information carried by newforms. In particular, it is proven in [RS] that if $\pi$ is generic, then $\pi$ is paramodular, and there exists a newform whose zeta integral is the $L$-factor $L(s, \pi)$. In this work we will give an alternative proof of the following theorem. See the introduction of $[\mathrm{RS}]$ for an extensive summary of the contents and proofs of [RS].

Theorem. ([RS]) Let $\pi$ be a supercuspidal, generic, irreducible, admissible representation of $\mathrm{GSp}(4, F)$ with trivial central character and Whittaker model $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Assume that $V(n)$ is non-zero for some non-negative integer $n$, and let $N_{\pi}$ be the smallest $n$ such that $V(n)$ is non-zero. Then $V\left(N_{\pi}\right)$ is one-dimensional, and there exists $W_{\pi}$ in $V\left(N_{\pi}\right)$ such that

$$
Z\left(s, W_{\pi}\right)=L(s, \pi)=1 .
$$

In what follows we will use the definitions and notation of [RS]. In particular, let $\mathfrak{o}$ be the ring of integers of $F$, let $\mathfrak{p}$ be the maximal ideal of $\mathfrak{o}$, let $q$ be the number of elements of $\mathfrak{o} / \mathfrak{p}$, fix a generator $\varpi$ of $\mathfrak{p}$, and let $\psi$ be a non-trivial character of $F$ with conductor $\mathfrak{o}$.

## 1 A Useful Realization

Our alternative proof of the above theorem is based on an alternative realization of paramodular vectors. This realization depends on the $\eta$ Principle proven in [RS]. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character. We will work in the Whittaker model $\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$ of $\pi$. The $\eta$ Principle asserts that if $W$ is a non-zero vector in $V(n)$ for some

[^0]non-negative integer $n$ and $W$ is degenerate, i.e., $Z(s, W)=0$, then $n \geq 2$ and there exists $W_{1}$ in $V(n-2)$ such that $W=\eta W_{1}$. Here, $\eta$ is the level raising operator that increases the level by 2 and is given by the action of the group element with the same name:
\[

\eta=\left[$$
\begin{array}{cccc}
\varpi^{-1} & & & \\
& 1 & & \\
& & 1 & \\
& & & \varpi
\end{array}
$$\right]
\]

Since it is given by the action of a single group element, the level raising operator $\eta$ is obviously injective. Besides vectors of the form $\eta W=\pi(\eta) W$, in what follows we will often encounter vectors of the form $\pi\left(\eta^{-1}\right) W$. The reader should note that $\pi\left(\eta^{-1}\right) W$ may not be paramodular even if $W$ is paramodular. Indeed, the $\eta$ Principle asserts that if $W$ is paramodular and non-zero, then $\pi\left(\eta^{-1}\right) W$ is paramodular if and only if the level of $W$ is at least 2 and $W$ is degenerate. To obtain another model for paramodular vectors using the $\eta$ Principle, let

$$
\Delta_{i j}=\left[\begin{array}{cccc}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]
$$

for integers $i$ and $j$. For $n$ a non-negative integer, $W$ in $V(n)$ and $0 \leq i, j<\infty$ define

$$
m(W)_{i j}=W\left(\Delta_{i j}\right)
$$

and let $m(W)$ be the matrix

$$
m(W)=\left(m(W)_{i j}\right)_{0 \leq i, j<\infty}
$$

The connection between $m(W)$ and $\eta$ is provided by the observation that

$$
\begin{equation*}
W\left(\Delta_{i j}\right)=\left(\pi\left(\eta^{-i}\right) W\right)\left(\Delta_{0 j}\right) \tag{1}
\end{equation*}
$$

for all $i$ and $j$ with $0 \leq i, j<\infty$ and $W \in V(n)$. Thus, the $i$-th row of $m(W)$ is obtained by evaluating the vector $\pi\left(\eta^{-i}\right) W$ at the points $\Delta_{0 j}$ for $0 \leq j<\infty$. We denote by $M(n)$ the $\mathbb{C}$ vector space of all $m(W)$ for $W \in V(n)$. Using the $\eta$ Principle, we can prove that $M(n)$ is a model of $V(n)$.

Proposition 1.1. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. For each non-negative integer $n$ the map

$$
V(n) \xrightarrow{\sim} M(n) .
$$

that sends $W$ to $m(W)$ is an isomorphism of vector spaces.
Proof. Let $W \in V(n)$ be non-zero. Thanks to the $\eta$ Principle, Theorem 4.3.7 of [RS], we can write $W=\eta^{i} W_{1}$ for some non-negative integer $i$ and $W_{1} \in V(n-2 i)$ with $Z\left(s, W_{1}\right) \neq 0$. We will prove that the $i$-th row of $m(W)$ is non-zero. By (1), the $i$-th row of $m(W)$ is

$$
W_{1}\left(\Delta_{0 j}\right), \quad 0 \leq j<\infty
$$

By Sect. 4.1 of $[R S]$ we have

$$
Z\left(s, W_{1}\right)=\left(1-q^{-1}\right) \sum_{j=0}^{\infty} q^{3 j / 2} W_{1}\left(\Delta_{0 j}\right)\left(q^{-s}\right)^{j} .
$$

Since $Z\left(s, W_{1}\right) \neq 0$ we have $W_{1}\left(\Delta_{0 j}\right) \neq 0$ for some non-negative $j$, so that the $i$-th row of $m(W)$ is non-zero.

If $\pi$ is a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$ is the Whittaker model of $\pi, n$ is a non-negative integer, and $W \in V(n)$, then the matrix $m(W)$ may have infinitely many non-zero entries. However, as the next proposition shows, if $\pi$ is supercuspidal, then $m(W)$ has only finitely many non-zero entries.

Proposition 1.2. Let $\pi$ be a supercuspidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$, and let $n \geq 0$ be a non-negative integer. If $W \in V(n)$, then $m(W)$ has finitely many non-zero entries.

Proof. We use the observations and notation from the proof of Proposition 2.6.4 of [RS] which involve $P_{3}$-theory. By that proof, keeping in mind that $V_{2}=V_{Z^{J}}$ because $\pi$ is supercuspidal, there exists a surjective linear map

$$
V \rightarrow \mathrm{c}-\operatorname{Ind}_{U_{3}}^{P_{3}} \Theta
$$

such that if $W$ maps to $f$, then $W(q)=f(i(q))$ for $q$ in the Klingen parabolic subgroup $Q$ of $\operatorname{GSp}(4, F)$ and $i: Q \rightarrow P_{3}$ the surjective homomorphism from Lemma 2.5.1 of [RS]. Let $W \in V$ and let $W$ map to $f$. Then

$$
W\left(\Delta_{i j}\right)=f\left(\left[\begin{array}{lll}
\varpi^{i+j} & & \\
& \varpi^{i} & \\
& & 1
\end{array}\right]\right)
$$

for any integers $i$ and $j$. Since $f$ is left invariant under a compact, open subgroup of $P_{3}$ and is compactly supported modulo the subgroup $U_{3}$, the above quantity is non-zero for only finitely many $i$ and $j$.

In the remainder of this section we translate some of the operators that act on paramodular vectors to the new model $M(n)$. These operators include the level raising operators $\eta, \theta$ and $\theta^{\prime}$. However, we will also need to describe a formula involving a certain level lowering operator in terms of the new model.

To give the formulas we need some notation. Let $M_{\infty \times \infty}(\mathbb{C})$ be the set of all matrices $\left(m_{i j}\right)_{0 \leq i, j<\infty}$ with $m_{i j} \in \mathbb{C}$. The space $M(n)$ is contained in $M_{\infty \times \infty}(\mathbb{C})$. It will be convenient to write the elements $A$ of $M_{\infty \times \infty}(\mathbb{C})$ as a column of rows,

$$
A=\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right] .
$$

We define two shift operations Left and Right on row vectors,

$$
\operatorname{Left}\left(a_{0}, a_{1}, a_{2}, \ldots\right)=\left(a_{1}, a_{2}, a_{3}, \ldots\right)
$$

$$
\operatorname{Right}\left(a_{0}, a_{1}, a_{2}, \ldots\right)=\left(0, a_{0}, a_{1}, \ldots\right)
$$

Using this notation we can describe the level raising operators $\theta, \theta^{\prime}$ and $\eta$ in the alternative model.

Proposition 1.3. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. For each non-negative integer $n$ define

$$
\theta, \theta^{\prime}, \eta: M_{\infty \times \infty}(\mathbb{C}) \rightarrow M_{\infty \times \infty}(\mathbb{C})
$$

by

$$
\theta\left(\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]\right)=q\left[\begin{array}{c}
0 \\
\operatorname{Left}\left(r_{0}\right) \\
\operatorname{Left}\left(r_{1}\right) \\
\vdots
\end{array}\right]+\left[\begin{array}{c}
\operatorname{Right}\left(r_{0}\right) \\
\operatorname{Right}\left(r_{1}\right) \\
\operatorname{Right}\left(r_{2}\right) \\
\vdots
\end{array}\right], \quad \theta^{\prime}\left(\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]\right)=q\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]+\left[\begin{array}{c}
0 \\
r_{0} \\
r_{1} \\
\vdots
\end{array}\right] .
$$

and

$$
\eta\left(\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]\right)=\left[\begin{array}{c}
0 \\
r_{0} \\
r_{1} \\
\vdots
\end{array}\right]
$$

The diagrams

and

commute
Proof. This follows by direct computations using the explicit formulas from Sect. 3.2 of [RS].

The work $[\mathrm{RS}]$ also introduced a certain level lowering operator $\delta_{1}$ that reduces the level by 1 , and we will need a formula involving $\delta_{1}$ in the setting of the alternative model. Let $(\pi, V)$ be an irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character. Let $n$ be an integer with $n \geq 1$. Then $\delta_{1}: V(n) \rightarrow V(n-1)$ is the natural trace operator, defined by the formula

$$
\delta_{1} v=\sum_{g \in \mathrm{~K}\left(\mathfrak{p}^{n-1}\right) /\left(\mathrm{K}\left(\mathfrak{p}^{n-1}\right) \cap \mathrm{K}\left(\mathfrak{p}^{n}\right)\right)} \pi(g) v .
$$

We first present and prove the relevant formula in an abstract form.

Proposition 1.4. Let $(\pi, V)$ be an irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be an integer with $n \geq 2$. If $v \in V(n)$, then

$$
\begin{aligned}
\eta \delta_{1} v=\delta_{1} \theta^{\prime} v-q^{2} v-q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda & \mu & \kappa \varpi^{-n} \\
& 1 & & \mu \\
& & 1 & -\lambda \\
& & & 1
\end{array}\right] \eta^{-1}\right) \theta^{\prime} v d \lambda d \mu d \kappa \\
+q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & -\lambda \varpi^{-1} \\
& & & 1
\end{array}\right]\right) v d \lambda d \mu
\end{aligned}
$$

Proof. We have by (3.3.7) of [RS]

$$
\begin{gathered}
\eta \delta_{1} v=q^{3} \pi(\eta) \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & \\
\lambda \varpi^{n-1} & 1 & 1 & \\
\mu \varpi^{n-1} \mu & & 1 \\
\kappa \varpi^{n-1} & \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right) v d \lambda d \mu d \kappa \\
+q^{2} \pi(\eta) \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda & \mu & \\
& 1 & & \mu \\
& & 1 & -\lambda \\
& & 1
\end{array}\right] \eta^{-1}\right) v d \lambda d \mu
\end{gathered}
$$

Therefore,

$$
\begin{aligned}
& \eta \delta_{1} v=q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
\kappa \varpi^{n+1} & \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\right) \pi(\eta) v d \lambda d \mu d \kappa \\
& +q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & \begin{array}{c}
-\lambda \varpi^{-1} \\
\\
\end{array} \\
& & 1
\end{array}\right]\right) v d \lambda d \mu \\
& =q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o} \times} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
\kappa \varpi^{n+1} & \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\right) \pi(\eta) v d \lambda d \mu d \kappa \\
& +q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{p}} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
\kappa \varpi^{n+1} & \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\right) \pi(\eta) v d \lambda d \mu d \kappa \\
& \left.+q^{2} \int_{0} \int_{0}\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & \begin{array}{c}
-\lambda \varpi^{-1} \\
\\
\end{array} \\
& & 1
\end{array}\right]\right) v d \lambda d \mu
\end{aligned}
$$

Applying the identity (2.8) from $[\mathrm{RS}]$ we have:

$$
\begin{aligned}
& \eta \delta_{1} v=q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o} \times} \pi\left(\left[\begin{array}{ccccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
& \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \kappa^{-1} \varpi^{-(n+1)} \\
& 1 & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \times\left[\begin{array}{cccc}
-\kappa^{-1} \varpi^{-(n+1)} & & & \\
& 1 & & \\
& & 1 & \\
& & & -\kappa \varpi^{n+1}
\end{array}\right]\left[\begin{array}{rlll} 
& & & 1 \\
& 1 & & \\
& & 1 & \\
-1 & & &
\end{array}\right] \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \kappa^{-1} \varpi^{-(n+1)} \\
& 1 & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right) \pi(\eta) v d \lambda d \mu d \kappa \\
& +q^{2} \int_{0} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
& \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\right) \pi(\eta) v d \lambda d \mu \\
& \left.+q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}}\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & \begin{array}{c}
-\lambda \varpi^{-1} \\
\\
\end{array} \\
& & 1
\end{array}\right]\right) v d \lambda d \mu \\
& =q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o} \times} \pi\left(\left[\begin{array}{ccccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\
\mu \varpi^{n} & & 1 & \\
& \mu \varpi^{n} & -\lambda \varpi^{n} & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \kappa \varpi^{-(n+1)} \\
& 1 & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right) v d \lambda d \mu d \kappa \\
& +q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n} & 1 & & \\

\end{array}\right] \eta^{-1}\right) \theta^{\prime} v d \lambda d \mu d \kappa
\end{aligned}
$$

$$
\left.+q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}}\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & -\lambda \varpi^{-1} \\
& & & 1
\end{array}\right]\right) v d \lambda d \mu
$$

The last equality follows from (3.23) of [RS].
The next corollary translates the last proposition to the setting of the alternative model for $V(n)$. In contrast to the previous proposition, the alternative model requires that the representation is generic.

Corollary 1.5. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Define

$$
J: M_{\infty \times \infty}(\mathbb{C}) \rightarrow M_{\infty \times \infty}(\mathbb{C})
$$

by

$$
J(A)=\left[\begin{array}{c}
r_{0}+q^{2} r_{1} \\
q^{2} r_{2} \\
q^{2} r_{3} \\
\vdots
\end{array}\right] \quad \text { for } \quad A=\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right] .
$$

Let $n$ be a non-negative integer with $n \geq 2$. We have for $W \in V(n)$,

$$
m\left(\eta \delta_{1} W\right)=m\left(\delta_{1} \theta^{\prime} W\right)-q^{3} m(W)-q^{2} J(m(W))
$$

If $A \in m\left(\operatorname{ker} \delta_{1}\right)$, then $J(A) \in M(n)$. The diagram

$$
\begin{array}{rlr}
\operatorname{ker}\left(\delta_{1}\right) & \sim m\left(\operatorname{ker} \delta_{1}\right) \\
q^{-2} \delta_{1} \theta^{\prime}-q \cdot \mathrm{Id} \downarrow & & \downarrow{ }^{\prime} \\
V(n) & \longrightarrow & \sim M(n) .
\end{array}
$$

commutes.
Proof. We apply the $m$ operator to the formula

$$
\begin{aligned}
& \eta \delta_{1} W=\delta_{1} \theta^{\prime} W-q^{2} W-q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda & \mu & \kappa \varpi^{-n} \\
& 1 & & \mu \\
& & 1 & -\lambda \\
& & & 1
\end{array}\right] \eta^{-1}\right) \theta^{\prime} W d \lambda d \mu d \kappa \\
& +q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & -\lambda \varpi^{-1} \\
& & & 1
\end{array}\right]\right) W d \lambda d \mu
\end{aligned}
$$

from Proposition 1.4 by evaluating both sides of this formula at the element $\Delta_{i j}$ for $0 \leq i, j<\infty$. We have

$$
-q^{3} \int_{0} \int_{0} \int_{\mathfrak{o}}\left(\theta^{\prime} W\right)\left(\left[\begin{array}{cccc}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & \lambda & \mu & \kappa \varpi^{-n} \\
& 1 & & \mu \\
& & 1 & -\lambda \\
& & 1
\end{array}\right] \eta^{-1}\right) d \lambda d \mu d \kappa
$$

$$
\begin{aligned}
& =-q^{3} \int_{\mathfrak{o}}\left(\theta^{\prime} W\right)\left(\left[\begin{array}{cccc}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & \lambda & & \\
& 1 & & \\
& & 1 & -\lambda \\
& & & 1
\end{array}\right] \eta^{-1}\right) d \lambda \\
& =-q^{3} \int_{\mathfrak{o}} \psi\left(c_{1} \lambda \varpi^{i}\right)\left(\theta^{\prime} W\right)\left(\left[\begin{array}{llll}
\varpi^{2 i+j} & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right] \eta^{-1}\right) d \lambda \\
& =-q^{3}\left(\theta^{\prime} W\right)\left(\left[\begin{array}{llll}
\varpi^{2 i+j+1} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & \varpi^{-1}
\end{array}\right]\right) \\
& =-q^{3}\left(\theta^{\prime} W\right)\left(\left[\begin{array}{llll}
\varpi^{2 i+j+2} & & \\
& \varpi^{i+j+1} & & \\
& & \varpi^{i+1} & \\
& & & 1
\end{array}\right]\right) .
\end{aligned}
$$

By Lemma 3.2.2 of [RS], this equals

$$
\begin{aligned}
& -q^{3} W\left(\left[\begin{array}{cccc}
\varpi^{2 i+j+1} & & & \\
& \varpi^{i+j+1} & & \\
& & \varpi^{i+1} & \\
& & & \varpi
\end{array}\right]\right) \\
& -q^{4} W\left(\left[\begin{array}{llll}
\varpi^{2 i+j+2} & & \\
& \varpi^{i+j+1} & & \\
& & \varpi^{i+1} & \\
& & & 1
\end{array}\right]\right) \\
& =-q^{3} W\left(\left[\begin{array}{llll}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\right)-q^{4} W\left(\left[\begin{array}{lll}
\varpi^{2 i+j+2} & & \\
& \varpi^{i+j+1} & \\
& & \varpi^{i+1} \\
& & \\
& & \\
& &
\end{array}\right]\right. \\
& =-q^{3} m(W)_{i j}-q^{4} m(W)_{i+1, j} .
\end{aligned}
$$

Also,

$$
\begin{aligned}
& q^{2} \int_{0} \int_{0} W\left(\left[\begin{array}{llll}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & \mu \varpi^{-1} & \\
& 1 & & \mu \varpi^{-1} \\
& & 1 & -\lambda \varpi^{-1} \\
& & & 1
\end{array}\right]\right) d \lambda d \mu \\
& =q^{2} \int_{0} W\left(\left[\begin{array}{llll}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & \lambda \varpi^{-1} & & \\
& 1 & & \\
& & 1 & -\lambda \varpi^{-1} \\
& & & 1
\end{array}\right]\right) d \lambda \\
& =q^{2} \int_{\mathfrak{o}} \psi\left(c_{1} \varpi^{i-1} \lambda\right) W\left(\left[\begin{array}{llll}
\varpi^{2 i+j} & & & \\
& \varpi^{i+j} & & \\
& & \varpi^{i} & \\
& & & 1
\end{array}\right]\right) d \lambda \\
& = \begin{cases}0 & \text { if } i=0, \\
q^{2} m(W)_{i j} & \text { if } i>0 .\end{cases}
\end{aligned}
$$

The claims of the lemma follow from these computations.
The main application of the previous corollary will be at the minimal level $N_{\pi}$. At the minimal level, because the kernel of $\delta_{1}$ must be all of $V\left(N_{\pi}\right)$, the map $J$ is actually an endomorphism of $V\left(N_{\pi}\right)$.

Corollary 1.6. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Then the endomorphism

$$
J: V\left(N_{\pi}\right) \rightarrow V\left(N_{\pi}\right)
$$

is given by

$$
J(A)=\left[\begin{array}{c}
r_{0}+q^{2} r_{1} \\
q^{2} r_{2} \\
q^{2} r_{3} \\
\vdots
\end{array}\right] \quad \text { for } \quad A=\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]
$$

is an endomorphism of $V\left(N_{\pi}\right)$.

## 2 Analysis of the Second Row

In this section we expose some properties of the second row of the matrix $m(W)$ associated to a paramodular vector in a generic representation. We will use these properties, in combination with the results involving the level lowering operator $\delta_{1}$ from the previous section, to give the alternative proof of the theorem from the introduction.

To analyze the second row of $m(W)$ is it useful to use zeta integrals. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $W$ be a paramodular vector in $V$. As explained in the previous section, the second row of $m(W)$ is

$$
m(W)_{1 j}=W\left(\Delta_{1 j}\right)=\left(\pi\left(\eta^{-1}\right) W\right)\left(\Delta_{0 j}\right), \quad 0 \leq j<\infty
$$

The next proposition shows that these numbers are encapsulated in a certain auxiliary zeta integral.

Proposition 2.1. Let $\pi$ be a generic, irreducible, admissible representation of GSp $(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. For $W$ in $V$ define

$$
Z_{N}(s, W)=\int_{F^{\times}} W\left(\left[\begin{array}{cccc}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a
$$

If $n$ is a non-negative integer and $W \in V(n)$, then

$$
Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)=\left(1-q^{-1}\right) \sum_{j=0}^{\infty} q^{3 j / 2} m(W)_{1 j}\left(q^{-s}\right)^{j}
$$

Proof. Let $W \in V(n)$. We claim that

$$
W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)=0
$$

for $v(a)<0$. To see this, let $a \in F^{\times}$and $y \in \mathfrak{o}$. Then

$$
\begin{aligned}
W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right) & =W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\left[\begin{array}{llll}
1 & & & \\
& 1 & y & \\
& & 1 & \\
& & & 1
\end{array}\right]\right) \\
& =\psi\left(c_{2} a y\right) W\left(\left[\begin{array}{llll}
a & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right) .
\end{aligned}
$$

Since $\psi$ is non-trivial on $\mathfrak{p}^{-1}$ our claim follows. The remainder of the proposition follows by a computation.

Given this proposition, our next goal will be to analyze the auxiliary zeta integral $Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)$ for a paramodular vector $W$. We will show that this zeta integral satisfies a certain functional equation. This will be the basis for further analysis of the second row of $m(W)$. We begin by relating $Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)$ to the full zeta integral $Z\left(s, \pi\left(\eta^{-1}\right) W\right)$ : recall that the standard zeta integral also involves an integration over $F$.

Lemma 2.2. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-negative integer and $W \in V(n)$. Then

$$
Z\left(s, \pi\left(\eta^{-1}\right) W\right)=Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)+(q-1) q^{-3}\left(q^{-s}\right)^{-2} \cdot(Z(s, W)-W(1))
$$

Proof. We compute:

$$
\begin{aligned}
& Z\left(s, \eta^{-1} W\right) \\
& =\int_{F^{\times} \times} \int_{F} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =\int_{F^{\times}} \int_{v(x) \geq 0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& +\int_{F^{\times}} \int_{v(x)<0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a
\end{aligned}
$$

$$
\begin{aligned}
& =\int_{F^{\times}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d^{\times} a \\
& +\int_{F^{\times}} \int_{v(x)<0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& 1 & x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \times\left[\begin{array}{llll}
1 & & & \\
& -x^{-1} & & \\
& & -x & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& & 1 & \\
& -1 & & \\
& & & 1
\end{array}\right] \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
& 1 & x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}} \int_{v(x)<0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& 1 & x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{llll}
1 & & & \\
& -x^{-1} & & \\
& & -x & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}} \int_{v(x)<0} W\left(\left[\begin{array}{cccc}
1 & & & \\
& 1 & a x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{llll}
1 & & & \\
& x^{-1} & & \\
& & x & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F \times} \int_{v(x)<0} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a x^{-1} & & \\
& & x & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}} \int_{v(x)<0} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a \varpi & & & \\
& a x^{-1} & & \\
& & x & \\
& & & \varpi^{-1}
\end{array}\right]\right)|a|^{s-3 / 2} d x d^{\times} a .
\end{aligned}
$$

Now $v(a \varpi)<v\left(a x^{-1}\right) \Longleftrightarrow v(x)<-1$. Hence, by Lemma 4.1.2 of [RS],

$$
\begin{aligned}
& Z\left(s, \eta^{-1} W\right)=Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}} \int_{v(x)=-1} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a \varpi & & & \\
& a x^{-1} & & \\
& & x & \\
& & & \varpi^{-1}
\end{array}\right]\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}} \int_{v(x)=-1} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a \varpi & & & \\
& a \varpi & & \\
& & \varpi^{-1} & \\
& & & \varpi^{-1}
\end{array}\right]\right)|a|^{s-3 / 2} d x d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +\int_{F^{\times}}\left(\int_{v(x)=-1} \psi\left(c_{2} a x^{-1}\right) d x\right) W\left(\left[\begin{array}{llll}
a \varpi^{2} & & & \\
& a \varpi^{2} & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a .
\end{aligned}
$$

It is easily computed that

$$
\int_{v(x)=-1} \psi\left(c_{2} a x^{-1}\right) d x= \begin{cases}0 & \text { if } v(a)<-2 \\ -1 & \text { if } v(a)=-2 \\ q-1 & \text { if } v(a)>-2\end{cases}
$$

Hence

$$
\begin{aligned}
& Z\left(s, \eta^{-1} W\right)=Z_{N}\left(s, \eta^{-1} W\right) \\
& +(-1) \int_{v(a)=-2} W\left(\left[\begin{array}{llll}
1 & & & \\
& 1 & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)\left|\varpi^{-2}\right|^{s-3 / 2} d^{\times} a \\
& +(q-1) \int_{v(a)>-2} W\left(\left[\begin{array}{llll}
a \varpi^{2} & & & \\
& a \varpi^{2} & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right) \\
& +(-1) W(1)|\varpi|^{3-2 s}\left(\int_{v(a)=-2} d^{\times} a\right) \\
& +(q-1) \int_{F^{\times}} \chi_{v(t)>-2}(a) W\left(\left[\begin{array}{llll}
a \varpi^{2} & & & \\
& a \varpi^{2} & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right)+(-1) W(1)\left(1-q^{-1}\right)|\varpi|^{3-2 s} \\
& +(q-1) \int_{F^{\times}} \chi_{v(t)>-2}\left(a \varpi^{-2}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)\left|a \varpi^{-2}\right|^{s-3 / 2} d^{\times} a
\end{aligned}
$$

$$
\begin{aligned}
& =Z_{N}\left(s, \eta^{-1} W\right)+(-1) W(1)\left(1-q^{-1}\right)|\varpi|^{3-2 s} \\
& +(q-1)|\varpi|^{3-2 s} \int_{F^{\times}} \chi_{v(t)>0}(a) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a \\
& =Z_{N}\left(s, \eta^{-1} W\right)+(-1) W(1)\left(1-q^{-1}\right)|\varpi|^{3-2 s} \\
& +(q-1)|\varpi|^{3-2 s}\left(Z(s, W)-\int_{v(a)=0} W(1) d^{\times} a\right) \\
& =Z_{N}\left(s, \eta^{-1} W\right)+(-1) W(1)\left(1-q^{-1}\right)|\varpi|^{3-2 s} \\
& +(q-1)|\varpi|^{3-2 s}\left(Z(s, W)-\left(1-q^{-1}\right) W(1)\right) \\
& =Z_{N}\left(s, \eta^{-1} W\right)+Z(s, W)(q-1)|\varpi|^{3-2 s} \\
& +(-1) W(1)\left(1-q^{-1}\right)|\varpi|^{3-2 s}-(q-1)\left(1-q^{-1}\right) W(1)|\varpi|^{3-2 s} \\
& =Z_{N}\left(s, \eta^{-1} W\right)+Z(s, W)(q-1)|\varpi|^{3-2 s} \\
& +\left(-\left(1-q^{-1}\right)-(q-1)\left(1-q^{-1}\right)\right) W(1)|\varpi|^{3-2 s} \\
& =Z_{N}\left(s, \eta^{-1} W\right)+Z(s, W)(q-1)|\varpi|^{3-2 s} \\
& -(q-1) W(1)|\varpi|^{3-2 s} \\
& =Z_{N}\left(s, \eta^{-1} W\right)+(q-1)|\varpi|^{3-2 s}(Z(s, W)-W(1)) \text {. }
\end{aligned}
$$

This completes the proof.
Next, we present the functional equation satified by the auxiliary zeta integral. This requires the introduction of a new concept, namely an operator on meromorphic functions on the complex plane having to do with functional equations. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. If $n$ is a non-negative integer, then we define the operator $u_{n}[\cdot]$ on the vector space of meromorphic functions on $\mathbb{C}$ by the formula

$$
u_{n}[f(s)]=q^{n / 2}\left(q^{-s}\right)^{n} \gamma(1-s, \pi) f(1-s) .
$$

A computation shows that

$$
u_{n}\left[u_{n}[f(s)]\right]=f(s)
$$

for any meromorphic function on the complex plane. Moreover, if $W$ is in $V$, then

$$
u_{n}[Z(s, W)]=Z\left(s, \pi\left(u_{n}\right) W\right)
$$

This is a translation of the functional equation for zeta integrals.
Proposition 2.3. Let $\pi$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-negative integer such that $n \geq 2$ and let $W \in V(n)$. Then

$$
\begin{aligned}
& \left(q^{-s}\right)^{2} Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)-q^{-1} u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)\right] \\
& =(q-1) q^{-2}\left(\left(q^{-s}\right)^{2}-q^{-1}\right) Z(s, W) \\
& \quad \quad-(q-1) q^{-2}\left(u_{n}\left[\left(\pi\left(u_{n}\right) W\right)(1)\right]\left(q^{-s}\right)^{2}-W(1) q^{-1}\right) .
\end{aligned}
$$

Proof. The identity

$$
\eta^{-1} u_{n}=\left[\begin{array}{cccc}
\varpi & & & \\
& \varpi & & \\
& & \varpi & \\
& & & \varpi
\end{array}\right] u_{n-2} \eta^{-1}
$$

implies that $\pi\left(\eta^{-1} u_{n}\right)=\pi\left(u_{n-2} \eta^{-1}\right)$. Therefore,

$$
Z\left(s, \pi\left(\eta^{-1} u_{n}\right) W\right)=Z\left(s, \pi\left(u_{n-2} \eta^{-1}\right) W\right)
$$

We will compute both sides of this equation using Lemma 2.2. First of all,

$$
\begin{aligned}
Z\left(s, \pi\left(\eta^{-1} u_{n}\right) W\right) & =Z_{N}\left(s, \pi\left(\eta^{-1} u_{n}\right) W\right) \\
& +(q-1) q^{-3}\left(q^{-s}\right)^{-2}\left(Z\left(s, \pi\left(u_{n}\right) W\right)-\left(\pi\left(u_{n}\right) W\right)(1)\right)
\end{aligned}
$$

And using Lemma 2.2,

$$
\begin{aligned}
& Z\left(s, \pi\left(u_{n-2} \eta^{-1}\right) W\right) \\
& =Z\left(s, \pi\left(\left[\begin{array}{cccc}
1 & & & \\
& 1 & & \\
& & \varpi^{n-2} & \\
& & & \varpi^{n-2}
\end{array}\right] u_{0} \eta^{-1}\right) W\right) \\
& =Z\left(s, \pi\left(\left[\begin{array}{llll}
\varpi^{-(n-2)} & & & \\
& \varpi^{-(n-2)} & & \\
& & 1 & \\
& & & 1
\end{array}\right] u_{0} \eta^{-1}\right) W\right) \\
& =\left|\varpi^{-(n-2)}\right|^{1 / 2-s} Z\left(s, \pi\left(u_{0} \eta^{-1}\right) W\right) \\
& =|\varpi|^{(n-2)(s-1 / 2)} Z\left(s, \pi\left(u_{0} \eta^{-1}\right) W\right) \\
& =|\varpi|^{(n-2)(s-1 / 2)} \gamma(1-s) Z\left(1-s, \pi\left(\eta^{-1}\right) W\right) \\
& =|\varpi|^{(n-2)(s-1 / 2)} \gamma(1-s)\left(Z_{N}\left(1-s, \pi\left(\eta^{-1}\right) W\right)\right. \\
& \left.+(q-1) q^{-3}\left(q^{-(1-s)}\right)^{-2}(Z(1-s, W)-W(1))\right) \\
& =\left(q^{-s}\right)^{-2} q^{-1} q^{-n s} q^{n / 2} \gamma(1-s)\left(Z_{N}\left(1-s, \pi\left(\eta^{-1}\right) W\right)\right. \\
& \left.+(q-1) q^{-1} q^{-2 s}(Z(1-s, W)-W(1))\right) \\
& =\left(q^{-s}\right)^{-2} q^{-1} q^{-n s} q^{n / 2} \gamma(1-s) Z_{N}\left(1-s, \pi\left(\eta^{-1}\right) W\right) \\
& +(q-1) q^{-2} q^{-n s} q^{n / 2} \gamma(1-s) Z(1-s, W) \\
& -(q-1) q^{-2} q^{-n s} q^{n / 2} \gamma(1-s) W(1) \\
& =\left(q^{-s}\right)^{-2} q^{-1} u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)\right] \\
& +(q-1) q^{-2} u_{n}[Z(s, W)] \\
& -(q-1) q^{-2} u_{n}[W(1)] \\
& =\left(q^{-s}\right)^{-2} q^{-1} u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)\right] \\
& +(q-1) q^{-2}\left(Z\left(s, \pi\left(u_{n}\right) W\right)-u_{n}[W(1)]\right) .
\end{aligned}
$$

Equating and multiplying by $\left(q^{-s}\right)^{2}$ now produces an equation. If $\pi\left(u_{n}\right) W$ is substituted in this equation for $W$ then the result follows.

More work is required to exploit the functional equation involving the auxiliary zeta integral $Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)$. Our next goal will be to prove that the factor

$$
u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)\right]
$$

from the functional equation is actually $Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)$ under the assumption that $\delta_{1} W=0$ and $\delta_{1} \pi\left(u_{n}\right) W=0$. Here, $\delta_{1}$ is the level lowering operator mentioned in the previous section. This will make for a simpler functional equation, and will be applicable at the minimal paramodular level $N_{\pi}$; we will also apply it to some vectors at level $N_{\pi}+1$. In what follows we use a certain operator $R$ introduced in Sect. 7.3 of [RS]. Let $(\pi, V)$ be an irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $W$ be in $V$. Then we set

$$
R W=q \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right) W d \lambda
$$

As always, we use the Haar measure on $F$ that assigns $\mathfrak{o}$ measure one. The next lemma relates the auxiliary zeta integral to the zeta integral of $\delta_{1} W$ and $R W$. This lemma will be the basis for proving that the above factor is $Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)$ under the mentioned conditions, though more work about zeta integrals involving $R W$ will also be required.

Lemma 2.4. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-nonegative integer with $n \geq 2$, and let $W \in V(n)$. then

$$
Z\left(s, \delta_{1} W\right)=q^{3} Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)+Z_{N}(s, R W)
$$

Proof. Recall from Lemma 3.3.7 of $[\mathrm{RS}]$ that $\delta_{1} W=W_{1}+W_{2}$ with

$$
\begin{aligned}
& W_{1}=q^{3} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{O}} \pi\left(\left[\begin{array}{cccc}
1 & \lambda & \mu & \kappa \varpi^{1-n} \\
& 1 & & \mu \\
& & 1 & -\lambda \\
& & 1
\end{array}\right] \eta^{-1}\right) d \lambda d \mu d \kappa, \\
& W_{2}=q^{2} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \pi\left(\left[\begin{array}{cccc}
1 & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right) d \lambda d \mu .
\end{aligned}
$$

By Lemma 4.1.1 of [RS],

$$
Z\left(s, \delta_{1} W\right)=Z_{N}\left(s, \delta_{1} W\right)=Z_{N}\left(s, W_{1}\right)+Z_{N}\left(s, W_{2}\right)
$$

By the Whittaker transformation property,

$$
Z_{N}\left(s, W_{1}\right)=\int_{F^{\times}} W_{1}\left(\left[\begin{array}{cccc}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a
$$

$$
\begin{aligned}
& =q^{3} \int_{F^{\times}} \int_{0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & \lambda & & \\
& 1 & & \\
& & 1 & -\lambda \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d \lambda d^{\times} a \\
& =q^{3} \int_{F^{\times}} \int_{0} \psi\left(c_{1} \lambda\right) W\left(\left[\begin{array}{llll}
a & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d \lambda d^{\times} a \\
& =q^{3} \int_{F^{\times}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right] \eta^{-1}\right)|a|^{s-3 / 2} d^{\times} a \\
& =q^{3} Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right) .
\end{aligned}
$$

This is the first term on the right side of the asserted equality. The matrix identity

$$
\begin{aligned}
& {\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]=\left[\begin{array}{cccc}
1 & -x \mu \varpi^{-1} & x \lambda \varpi^{-1} & x \varpi^{-n} \\
& 1 & & x \lambda \varpi^{-1} \\
& & 1 & x \mu \varpi^{-1} \\
& & & 1
\end{array}\right]} \\
& \times\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right] \\
& \times\left[\begin{array}{cccc}
1 & & & -x \varpi^{-n} \\
& 1-x \lambda \mu \varpi^{n-2} & x \lambda^{2} \varpi^{n-2} & \\
& -x \mu^{2} \varpi^{n-2} & 1+x \lambda \mu \varpi^{n-2} & 1
\end{array}\right]
\end{aligned}
$$

shows that

$$
\begin{aligned}
& W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{ccccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right) \\
& =\psi\left(-c_{1} x \mu \varpi^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right)
\end{aligned}
$$

for all $x \in \mathfrak{o}$. Therefore, if $\mu$ is a unit, the above is zero. Hence

$$
\begin{aligned}
& Z_{N}\left(s, W_{2}\right)=\int_{F^{\times}} W_{2}\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a \\
& =q^{2} \int_{F^{\times}} \int_{\mathfrak{p}} \int_{\mathfrak{O}} W\left(\left[\begin{array}{lll}
a & & \\
& a & \\
& & 1
\end{array}\right.\right. \\
& \\
& \\
&
\end{aligned}
$$

$$
\begin{aligned}
& \left.\quad \times\left[\begin{array}{ccccc}
1 & & & \\
\lambda \varpi^{n-1} & 1 & & \\
\mu \varpi^{n-1} & & 1 & \\
& & \mu \varpi^{n-1} & -\lambda \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \lambda d \mu d^{\times} a \\
& =q \int_{F^{\times}} \int_{0} W\left(\left[\begin{array}{ccccc}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & \\
\lambda \varpi^{n-1} & 1 & & \\
& & & -\lambda \varpi^{n-1} \\
& 1
\end{array}\right]\right)|a|^{s-3 / 2} d \lambda d^{\times} a \\
&
\end{aligned}
$$

This proves the lemma.
Next, we relate $Z_{N}(s, R W)$ to $Z(s, R W)$.
Lemma 2.5. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-nonegative integer with $n \geq 2$, and let $W \in V(n)$. Then

$$
Z(s, R W)=q^{-1} Z_{N}(s, R W)+\left(1-q^{-1}\right) Z(s, W)
$$

Proof. We have

$$
\begin{aligned}
& Z(s, R W) \\
& =q \int_{F^{\times}} \int_{F} \int_{0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & & -\mu \varpi^{n-1}
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a .
\end{aligned}
$$

Let

$$
A=q \int_{F \times} \int_{v(x) \geq 1} \int_{\mathfrak{o}} \ldots d \mu d x d^{\times} a, \quad B=q \int_{F \times} \int_{v(x)<1} \int_{\mathfrak{o}} \ldots d \mu d x d^{\times} a .
$$

We compute

$$
\begin{aligned}
& A=q \int_{F^{\times}} \int_{v(x) \geq 1} \int_{0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \int_{F^{\times}} \int_{v(x) \geq 1} \int_{0} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{ccccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & & -\mu \varpi^{n-1} & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
& 1 & & \\
\varpi^{n-1} x \mu & x & 1 & \\
\varpi^{2 n-2} x \mu^{2} & \varpi^{n-1} x \mu & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a
\end{aligned}
$$

$$
\begin{aligned}
& =q \int_{F^{\times}} \int_{v(x) \geq 1} \int_{\mathfrak{o}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \cdot q^{-1} \int_{F \times} \int_{\mathfrak{o}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d^{\times} a \\
& =q^{-1} Z_{N}(s, R W) .
\end{aligned}
$$

This is the first term on the right side of the asserted equality. Next we compute

$$
\begin{aligned}
& B=q \int_{F^{\times}} \int_{v(x)<1} \int_{\mathfrak{o}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& x & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \int_{F^{\times}} \int_{v(x)<1} \int_{\mathfrak{o}} W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& 1 & x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \times\left[\begin{array}{llll}
1 & & & \\
& -x^{-1} & & \\
& & -x & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& & 1 & \\
& -1 & & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & \\
& 1 & x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right] \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \int_{F^{\times}} \int_{v(x)<1} \int_{0} W\left(\left[\begin{array}{cccc}
1 & & & \\
& 1 & a x^{-1} & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
& -x^{-1} & & \\
& & -x & \\
& & & 1
\end{array}\right] s_{2}\left[\begin{array}{cccc}
1 & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a
\end{aligned}
$$

$$
\begin{aligned}
& =q \int_{F^{\times}} \int_{v(x)<1} \int_{0} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& -a x^{-1} & & \\
& & -x & \\
& & & 1
\end{array}\right] s_{2}\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & & \varpi^{n-1}
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \int_{F^{\times}} \int_{v(x)<1} \int_{0} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& & & 1
\end{array}\right] s_{2}\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & & -\mu \varpi^{n-1} \\
& 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a .
\end{aligned}
$$

Let $y \in \varpi^{-1} \mathfrak{o}, a \in F^{\times}, v(x)<1$ and $\mu \in \mathfrak{o}$. Then

$$
\begin{aligned}
& \psi\left(c_{2} y\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& & & 1
\end{array}\right] s_{2}\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right) \\
& =W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& & & 1
\end{array}\right] s_{2}\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & & -\mu \varpi^{n-1}
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & \\
& 1 & \\
-a^{-1} \varpi^{n-1+2 v(x)} y \mu & -a^{-1} \varpi^{2 v(x)} y & 1 & \\
-a^{-1} \varpi^{2 n-2+2 v(x)} y \mu^{2} & -a^{-1} \varpi^{n-1+2 v(x)} y \mu & & 1
\end{array}\right]\right)
\end{aligned}
$$

If $2 v(x) \geq v(a)+2$, then the rightmost matrix is in $\mathrm{K}\left(\mathfrak{p}^{n}\right)$, implying that the above is zero. Similarly,

$$
\begin{aligned}
\psi\left(c_{1} y\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& \times\left[\begin{array}{cccc}
1 & & & 1
\end{array}\right] s_{2} \\
\mu \varpi^{n-1} & 1 & & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)
\end{aligned}
$$

$$
\begin{aligned}
& =W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{cccc}
1 & & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& & & 1
\end{array}\right] s_{2}\left[\begin{array}{cccc}
1 & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right. \\
& \left.\times\left[\begin{array}{cccc}
1 & & y \varpi^{-v(x)} \\
& 1 & \begin{array}{c}
-2 \varpi^{n-1-v(x)} \mu y \\
\\
\end{array} & \\
& & & y \varpi^{-v(x)} \\
& &
\end{array}\right]\right) \text {. }
\end{aligned}
$$

If $-1 \geq v(x)$ then the rightmost matrix is in $\mathrm{K}\left(\mathfrak{p}^{n}\right)$, implying that the above is zero. Therefore,

$$
\begin{aligned}
& B=q \int_{\substack{F \times}} \int_{\substack{v(x)<1 \\
v(x)<v(a)+2 \\
-1<v(x)}} \int_{\mathfrak{o}} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\left[\begin{array}{llll}
1 & & \\
& \varpi^{-v(x)} & & \\
& & \varpi^{v(x)} & \\
& & \\
& & &
\end{array}\right]\right. \\
& \left.\times s_{2}\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =q \int_{-2<v(a)} \int_{v(x)=0} \int_{\mathfrak{o}} \psi\left(c_{2} a x^{-1}\right) W\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right. \\
& \left.\times s_{2}\left[\begin{array}{cccc}
1 & & & \\
\mu \varpi^{n-1} & 1 & & \\
& & 1 & \\
& & -\mu \varpi^{n-1} & 1
\end{array}\right]\right)|a|^{s-3 / 2} d \mu d x d^{\times} a \\
& =\int_{-2<v(a)}\left(\int_{\mathfrak{o}^{\times}} \psi\left(c_{2} a x^{-1}\right) d x\right)\left(\pi\left(s_{2}\right) R W\right)\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a .
\end{aligned}
$$

Now

$$
\int_{\mathfrak{o}^{\times}} \psi\left(c_{2} a x^{-1}\right) d x= \begin{cases}0 & \text { if } v(a)<1 \\ -q^{-1} & \text { if } v(a)=-1 \\ 1-q^{-1} & \text { if } v(a)>-1\end{cases}
$$

Hence,

$$
\begin{aligned}
& B=-q^{-1} \int_{v(a)=-1}\left(\pi\left(s_{2}\right) R W\right)\left(\left[\begin{array}{llll}
a & & & \\
& a & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a \\
&+\left(1-q^{-1}\right) \int_{v(a) \geq 0}\left(\pi\left(s_{2}\right) R W\right)\left(\left[\begin{array}{lll}
a & & \\
& a & \\
& & 1 \\
& & \\
& & 1
\end{array}\right]\right)|a|^{s-3 / 2} d^{\times} a
\end{aligned}
$$

By Corollary 7.3.3 and Proposition 7.3.2 of [RS] the first term is zero and the second term is $\left(1-q^{-1}\right) Z_{N}\left(s, \pi\left(s_{2}\right) R W\right)=\left(1-q^{-1}\right) Z(s, W)$. Thus,

$$
B=\left(1-q^{-1}\right) Z(s, W)
$$

Hence,

$$
Z(s, R W)=A+B=q^{-1} Z_{N}(s, R W)+\left(1-q^{-1}\right) Z(s, W)
$$

This completes the proof.
Lemma 2.6. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-nonegative integer with $n \geq 2$, and let $W \in V(n)$. Then

$$
u_{n}\left[Z_{N}(s, R W)\right]=Z_{N}\left(s, R \pi\left(u_{n}\right) W\right)=Z_{N}\left(s, \pi\left(u_{n}\right) R W\right)
$$

Proof. We have by Lemma 2.5 and the basic properties of $u_{n}[\cdot]$ from above,

$$
\begin{aligned}
u_{n}\left[Z_{N}(s, R W)\right] & =u_{n}\left[q Z(s, R W)-\left(1-q^{-1}\right) q Z(s, W)\right] \\
& =q u_{n}[Z(s, R W)]-\left(1-q^{-1}\right) q u_{n}[Z(s, W)] \\
& =q Z\left(s, \pi\left(u_{n}\right) R W\right)-\left(1-q^{-1}\right) q Z\left(s, \pi\left(u_{n}\right) W\right) \\
& =q Z\left(s, R \pi\left(u_{n}\right) W\right)-\left(1-q^{-1}\right) q Z\left(s, \pi\left(u_{n}\right) W\right) \\
& =Z_{N}\left(s, R \pi\left(u_{n}\right) W\right) \\
& =Z_{N}\left(s, \pi\left(u_{n}\right) R W\right) .
\end{aligned}
$$

This completes the proof.
Lemma 2.7. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-nonegative integer with $n \geq 2$, and let $W \in V(n)$. Then

$$
\begin{aligned}
u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)\right]=Z_{N} & \left(s, \pi\left(\eta^{-1}\right) W\right) \\
& +q^{-3}\left(u_{n}\left[Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)\right]-Z\left(s, \delta_{1} W\right)\right)
\end{aligned}
$$

Proof. By Lemma 2.4,

$$
Z\left(s, \delta_{1} W\right)=q^{3} Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)+Z_{N}(s, R W)
$$

for $W \in V(n)$. Replacing $W$ with $\pi\left(u_{n}\right) W$, we obtain

$$
Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)=q^{-3} Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)-q^{-3} Z_{N}\left(s, R \pi\left(u_{n}\right) W\right) .
$$

Applying $u_{n}[\cdot]$ to both sides and using Lemmas 2.6 and 2.4, we get

$$
\begin{aligned}
u_{n} & {\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)\right] } \\
& =q^{-3} u_{n}\left[Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)\right]-q^{-3} u_{n}\left[Z_{N}\left(s, R \pi\left(u_{n}\right) W\right)\right] \\
& =q^{-3} u_{n}\left[Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)\right]-q^{-3} Z_{N}(s, R W) \\
& =q^{-3} u_{n}\left[Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)\right]-q^{-3}\left(Z\left(s, \delta_{1} W\right)-q^{3} Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)\right) \\
& =q^{-3} u_{n}\left[Z\left(s, \delta_{1} \pi\left(u_{n}\right) W\right)\right]-q^{-3} Z\left(s, \delta_{1} W\right)+Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right) .
\end{aligned}
$$

This completes the proof.

To end this section we finally deduce the formula relating the second row of $m(W)$ to the first row under the assumption that $\delta_{1} W=0$ and $\delta_{1} \pi\left(u_{n}\right) W=0$.

Proposition 2.8. Let $(\pi, V)$ be a generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-nonegative integer with $n \geq 2$, and let $W \in V(n)$. Assume $\delta_{1} W=0$ and $\delta_{1} \pi\left(u_{n}\right) W=0$. Then

$$
u_{n}\left[Z_{N}\left(s, \pi\left(\eta^{-1}\right) \pi\left(u_{n}\right) W\right)\right]=Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)
$$

and consequently,

$$
\begin{aligned}
Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)=(q-1) & q^{-2} Z(s, W) \\
& -(q-1) q^{-2} \frac{u_{n}\left[\left(\pi\left(u_{n}\right) W\right)(1)\right]\left(q^{-s}\right)^{2}-W(1) q^{-1}}{\left(q^{-s}\right)^{2}-q^{-1}}
\end{aligned}
$$

Proof. This is immediate from Lemma 2.7 and Proposition 2.3.

## 3 The Alternative Proof

In this final section we will give the alternative proof of the theorem stated in the introduction. In fact, we will prove more: besides proving the claims of the theorem we will also determine $m\left(W_{\pi}\right)$ completely. In the preceding two sections supercuspidality was only assumed in Proposition 1.2, which asserted that $m(W)$ has only finitely many non-zero entries if $W$ is paramodular and $\pi$ is supercuspidal. We will use this below. We will also use three other properties of supercuspidal representations. Let $(\pi, V)$ be a supercuspidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character. First, we will often use, without comment, that $Z(s, W)$ is a polynomial in $q^{-s}$ for a paramodular vector $W$ in $V$. This follows from Proposition 4.1.4 of [RS] since $L(s, \pi)=1$. Second, we will use that the $\gamma$-factor and the $\varepsilon$-factor of $\pi$ are the same: $\gamma(s, \pi)=\varepsilon(s, \pi)$. This follows because $L(s, \pi)=1$. We can and will write

$$
\begin{equation*}
\gamma(s, \pi)=\varepsilon(s, \pi)=c q^{-K s} \tag{2}
\end{equation*}
$$

for some integer $K$ and complex number $c$ by Proposition 2.6.6 of [RS]. Note that, as explained in the introduction to $[\mathrm{RS}]$, if one has the appropriate main results of [RS], then there is a formula for $\varepsilon(s, \pi)$ in terms of the invariants of a newform, but since we are giving an alternative proof we can not use this. Third, we will use that $N_{\pi} \geq 2$. This is true because if $N_{\pi} \leq 1$, then $\pi$ admits a non-zero vector fixed by the Iwahori subgroup, and is thus contained in a representation induced from the Borel subgroup. We begin with a lemma that will be applied at the minimal paramodular level $N_{\pi}$ and at level $N_{\pi}+1$.

Lemma 3.1. Let $(\pi, V)$ be a supercupsidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Let $n$ be a non-negative integer with $n \geq 2$. Assume that $W \in V(n)$ satisfies the following conditions:

$$
\delta_{1} W=0, \quad \delta_{1} \pi\left(u_{n}\right) W=0, \quad W(1)=0
$$

Then $\left(\pi\left(u_{n}\right) W\right)(1)=0$. If $V(n)$ contains no non-zero degenerate vectors, then $W=0$.

Proof. By Proposition 2.8 and $W(1)=0$, we have

$$
Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)=(q-1) q^{-2} Z(s, W)-(q-1) q^{-2} \frac{u_{n}\left[\left(\pi\left(u_{n}\right) W\right)(1)\right]\left(q^{-s}\right)^{2}}{\left(q^{-s}\right)^{2}-q^{-1}}
$$

Therefore, by the definition of $u_{n}[\cdot]$,

$$
\begin{aligned}
Z_{N}(s, & \left.\pi\left(\eta^{-1}\right) W\right)-(q-1) q^{-2} Z(s, W) \\
& =-(q-1) q^{-2} \cdot \frac{q^{n / 2}\left(q^{-s}\right)^{n+2} \gamma(s, \pi)^{-1}\left(\pi\left(u_{n}\right) W\right)(1)}{\left(q^{-s}\right)^{2}-q^{-1}} \\
& =-(q-1) q^{-2} \cdot \frac{c^{-1} q^{n / 2}\left(\pi\left(u_{n}\right) W\right)(1)\left(q^{-s}\right)^{n-K+2}}{\left(q^{-s}\right)^{2}-q^{-1}},
\end{aligned}
$$

Since the left hand side of this equation is a polynomial in $q^{-s}$ by Proposition 2.1 and Proposition 1.2, so is the right hand side. Therefore, as the denominator on the right hand side has roots $\pm q^{-1 / 2}$, we must have $\left(\pi\left(u_{n}\right) W\right)(1)=0$. Hence,

$$
Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)=(q-1) q^{-2} Z(s, W) .
$$

This implies that for $k \geq 0$,

$$
W\left(\left[\begin{array}{cccc}
\varpi^{k+1} & & & \\
& \varpi^{k} & & \\
& & 1 & \\
& & & \varpi^{-1}
\end{array}\right]\right)=(q-1) q^{-2} W\left(\left[\begin{array}{cccc}
\varpi^{k} & & & \\
& \varpi^{k} & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)
$$

or

$$
W\left(\left[\begin{array}{cccc}
\varpi^{2 \cdot 1+k} & & & \\
& \varpi^{1+k} & & \\
& & \varpi^{1} & \\
& & & 1
\end{array}\right]\right)=(q-1) q^{-2} W\left(\left[\begin{array}{cccc}
\varpi^{k} & & & \\
& \varpi^{k} & & \\
& & 1 & \\
& & & 1
\end{array}\right]\right)
$$

In terms of the matrix

$$
m(W)=\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]
$$

this means $r_{1}=(q-1) q^{-2} r_{0}$, or equivalently,

$$
r_{0}+q^{2} r_{1}-q r_{0}=0
$$

Since $\delta_{1} W=0$, we have by Corollary 1.5

$$
J(m(W))=\left[\begin{array}{c}
r_{0}+q^{2} r_{1} \\
q^{2} r_{2} \\
q^{2} r_{3} \\
\vdots
\end{array}\right] \in M(n)
$$

Therefore,

$$
\left[\begin{array}{c}
r_{0}+q^{2} r_{1} \\
q^{2} r_{2} \\
q^{2} r_{3} \\
\vdots
\end{array}\right]-q\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]=\left[\begin{array}{c}
0 \\
q^{2} r_{2}-q r_{1} \\
q^{2} r_{3}-q r_{2} \\
\vdots
\end{array}\right]
$$

is also contained in $M(n)$. Hence we produced a degenerate vector at level $n$. Since, by assumption, $V(n)$ has no non-zero degenerate vectors, it follows that

$$
\begin{aligned}
q r_{1} & =q^{2} r_{2}, \\
q r_{2} & =q^{2} r_{3}, \\
q r_{3} & =q^{2} r_{4}, \\
& \vdots
\end{aligned}
$$

Since $\pi$ is supercuspidal we have $r_{k}=0$ for sufficiently large $k$. This implies $0=r_{1}=r_{2}=r_{3}=\ldots$ As $r_{1}=(q-1) q^{-2} r_{0}$, we get $r_{0}=0$. Since $W \mapsto m(W)$ is an isomorphism, we conclude $W=0$.

The next theorem proves that there is uniqueness at the minimal paramodular level; this proves part of the theorem from the introduction. The remaining assertion of the theorem from the introduction will be proven in the final theorem below.

Theorem 3.2. Let $(\pi, V)$ be a supercupsidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=$ $\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. We have:

1. $\operatorname{dim} V\left(N_{\pi}\right)=1$.
2. Write $\varepsilon(s, \pi)=c q^{-K s}$ as in (2). Then $N_{\pi} \geq K$ and $N_{\pi} \equiv K$ (2).
3. $V\left(N_{\pi}\right)$ is spanned by an element $W$ with matrix $m(W)$ equal to

$$
\left[\begin{array}{ccccccccccc}
1 & 0 & q^{-2} & 0 & \cdots & 0 & q^{-\left(N_{\pi}-K\right)} & 0 & 0 & 0 & \cdots \\
-q^{-2} & 0 & -q^{-6} & 0 & \cdots & 0 & -q^{-\left(N_{\pi}-K+2\right)} & 0 & 0 & 0 & \cdots \\
0 & 0 & 0 & 0 & \cdots & 0 & 0 & 0 & 0 & 0 & \cdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots
\end{array}\right] .
$$

4. Let $\pi\left(u_{N_{\pi}}\right) W=\varepsilon_{\pi} W$. Then $\varepsilon_{\pi}=c q^{-K / 2}$.

Proof. We shall write $n$ for $N_{\pi}$. As we mentioned above, since $\pi$ is supercuspidal we have $n \geq 2$. Suppose that $\operatorname{dim} V(n)>1$. Let $W_{1}, W_{2} \in V(n)$ be linearly independent. There exist $a, b \in \mathbb{C}$ such that $W=a W_{1}+b W_{2}$ is not zero and $W(1)=0$. Since we are at the minimal level, $\delta_{1} W=\delta_{1} \pi\left(u_{n}\right) W=0$. By the $\eta$ Principle, Theorem 4.3 .7 of $[\mathrm{RS}]$, the space $V(n)$ contains no non-zero degenerate vectors. From Lemma 3.1 we conclude $W=0$, a contradiction. This proves $\operatorname{dim} V(n)=1$.

Next, let $W \in V(n)$ be non-zero. Write

$$
m(W)=\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]
$$

with

$$
r_{0}=\left(a_{0}, a_{1}, a_{2}, \ldots\right),
$$

$$
r_{1}=\left(b_{0}, b_{1}, b_{2}, \ldots\right)
$$

By definition,

$$
\begin{aligned}
Z(s, W) & =\sum_{k=0}^{\infty}\left(1-q^{-1}\right) a_{k} q^{3 k / 2}\left(q^{-s}\right)^{k} \\
Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right) & =\sum_{k=0}^{\infty}\left(1-q^{-1}\right) b_{k} q^{3 k / 2}\left(q^{-s}\right)^{k} .
\end{aligned}
$$

Also, let $\pi\left(u_{n}\right) W=\varepsilon_{\pi} W$. Similarly as in the proof of Lemma 3.1 we conclude from Proposition 2.8 that

$$
\begin{align*}
& Z_{N}\left(s, \pi\left(\eta^{-1}\right) W\right)-(q-1) q^{-2} Z(s, W) \\
& \quad=-(q-1) q^{-2} W(1) \cdot \frac{c^{-1} q^{n / 2} \varepsilon_{\pi}\left(q^{-s}\right)^{n-K+2}-q^{-1}}{\left(q^{-s}\right)^{2}-q^{-1}} . \tag{3}
\end{align*}
$$

As in the proof of Lemma 3.1, this is a polynomial in $q^{-s}$. It follows that $n \geq K$. Since $\pm q^{-1 / 2}$ are the roots of the denominator, $\pm q^{-1 / 2}$ are roots of the numerator. A computation shows that this implies that

$$
\varepsilon=c q^{-K / 2}, \quad n \equiv K(2)
$$

Hence (3) translates into the equality

$$
\begin{gather*}
\sum_{k=0}^{\infty}\left(1-q^{-1}\right)\left(b_{k}-(q-1) q^{-2} a_{k}\right) q^{3 k / 2}\left(q^{-s}\right)^{k} \\
=-(q-1) q^{-2} a_{0} \sum_{k=0}^{(n-K) / 2} q^{k}\left(q^{-s}\right)^{2 k} \tag{4}
\end{gather*}
$$

Now since $\operatorname{dim} V(n)=1$, there exists $a \in \mathbb{C}$ such that $J(m(W))=a m(W)$. That is,

$$
J(m(W))=\left[\begin{array}{c}
r_{0}+q^{2} r_{1} \\
q^{2} r_{2} \\
q^{2} r_{3} \\
\vdots
\end{array}\right]=a\left[\begin{array}{c}
r_{0} \\
r_{1} \\
r_{2} \\
\vdots
\end{array}\right]
$$

Solving, we find that

$$
r_{k}=q^{-2 k} a^{k-1}(a-1) r_{0}, \quad k \geq 1 .
$$

Again, $r_{k}=0$ for sufficiently large $k$. Also, $r_{0} \neq 0$ since $W$ must be nondegenerate by the $\eta$ Principle. Therefore, $a=0$ or $a=1$. Assume $a=1$; we will obtain a contraction. Since $a=1$,

$$
m(W)=\left[\begin{array}{c}
r_{0} \\
0 \\
0 \\
\vdots
\end{array}\right]
$$

In particular, $r_{1}=0$. Therefore, from (4) we get

$$
\begin{aligned}
-(q-1) q^{-2} Z(s, W) & =\sum_{k=0}^{\infty}-\left(1-q^{-1}\right)(q-1) q^{-2} a_{k} q^{3 k / 2}\left(q^{-s}\right)^{k} \\
& =-(q-1) q^{-2} a_{0} \sum_{k=0}^{(n-K) / 2} q^{k}\left(q^{-s}\right)^{2 k}
\end{aligned}
$$

Since $Z(s, W) \neq 0$, we have $a_{0} \neq 0$. Comparing constant terms, we get

$$
\begin{aligned}
-\left(1-q^{-1}\right)(q-1) q^{-2} a_{0} & =-(q-1) q^{-2} a_{0} \\
1-q^{-1} & =1
\end{aligned}
$$

a contradiction. Therefore, $a=0$. Since $a=0$, we have

$$
m(W)=\left[\begin{array}{c}
r_{0} \\
-q^{-2} r_{0} \\
0 \\
\vdots
\end{array}\right]
$$

i.e.,

$$
b_{k}=-q^{-2} a_{k}, \quad k \geq 0
$$

Therefore, we get from (4) that

$$
\sum_{k=0}^{\infty} q^{3 k / 2} a_{k}\left(q^{-s}\right)^{k}=a_{0} \sum_{k=0}^{(n-K) / 2} q^{k}\left(q^{-s}\right)^{2 k}
$$

We obtain $a_{0} \neq 0$. Dividing if necessary, we may assume that $a_{0}=1$. Therefore,

$$
a_{i}= \begin{cases}0 & \text { if } i \text { is odd or } i>n-K \\ q^{-i} & \text { if } i \text { is even and } 0 \leq i \leq n-K\end{cases}
$$

The remaining claims of the theorem follow.
Lemma 3.3. Let $(\pi, V)$ be a supercupsidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. Then $\operatorname{dim} V\left(N_{\pi}+1\right) \leq 3$.

Proof. For convenience, write $n=N_{\pi}$. By Theorem 3.2 we have $\operatorname{dim} V(n)=1$. Choosing any isomorphism $V(n) \cong \mathbb{C}$, we can consider $\delta_{1}: V(n+1) \rightarrow V(n)$ as a linear form on $V(n+1)$. We consider further the linear forms $\delta_{1} \circ \pi\left(u_{n+1}\right)$ and $\varphi: W \mapsto W(1)$ on $V(n+1)$. Let $W \in V(n+1)$ and assume that

$$
W \in \operatorname{ker}\left(\delta_{1}\right) \cap \operatorname{ker}\left(\delta_{1} \circ \pi\left(u_{n+1}\right)\right) \cap \operatorname{ker}(\varphi)
$$

In other words, $W$ is an element such that $\delta_{1} W=0$ and $\delta_{1} \pi\left(u_{n+1}\right) W=0$ and $W(1)=0$. Lemma 3.1 implies that $W=0$; note that $V(n+1)$ contains no degenerate vectors by the $\eta$ Principle from [RS]. This shows that $\operatorname{ker}\left(\delta_{1}\right) \cap$ $\operatorname{ker}\left(\delta_{1} \circ \pi\left(u_{n+1}\right)\right) \cap \operatorname{ker}(\varphi)=0$. On the other hand,

$$
\operatorname{dim}\left(\operatorname{ker}\left(\delta_{1}\right) \cap \operatorname{ker}\left(\delta_{1} \circ \pi\left(u_{n+1}\right)\right) \cap \operatorname{ker}(\varphi)\right) \geq \operatorname{dim}(V(n+1))-3
$$

since with every linear form the dimension can go down by at most one. The assertion follows.

Theorem 3.4. Let $(\pi, V)$ be a supercupsidal, generic, irreducible, admissible representation of $\operatorname{GSp}(4, F)$ with trivial central character, and let $V=$ $\mathcal{W}\left(\pi, \psi_{c_{1}, c_{2}}\right)$. The newform in Theorem 3.2 iii) is given by

$$
m(W)=\left[\begin{array}{ccc}
1 & 0 & \cdots \\
-q^{-2} & 0 & \cdots \\
0 & 0 & \cdots \\
\vdots & \vdots &
\end{array}\right]
$$

Proof. Again for convenience we let $n=N_{\pi}$. Let $W_{0}$ be the vector in Theorem 3.2. By this theorem, we have

$$
m\left(W_{0}\right)=\left[\begin{array}{c}
s_{0} \\
-q^{-2} s_{0} \\
0
\end{array}\right], \quad s_{0}=\left(1,0, q^{-2}, 0, q^{-4}, \ldots, q^{-(n-K)}, 0,0, \ldots\right)
$$

(all the matrices in this proof will have zeros in the fourth row and beyond, hence we shall only write the first three rows). By Proposition 1.3 we have

$$
m\left(\theta^{\prime} W_{0}\right)=\left[\begin{array}{c}
q s_{0}  \tag{5}\\
\left(1-q^{-1}\right) s_{0} \\
-q^{-2} s_{0}
\end{array}\right]
$$

and

$$
m\left(\theta W_{0}\right)=q\left[\begin{array}{c}
0  \tag{6}\\
\operatorname{Left}\left(s_{0}\right) \\
\operatorname{Left}\left(-q^{-2} s_{0}\right)
\end{array}\right]+\left[\begin{array}{c}
\operatorname{Right}\left(s_{0}\right) \\
\operatorname{Right}\left(-q^{-2} s_{0}\right) \\
0
\end{array}\right]
$$

Define $W_{1}:=q^{-2} \delta_{1} \theta^{\prime} \theta W_{0}-q \theta W_{0} \in V(n+1)$. By Lemma 1.5 we have

$$
q^{-2} m\left(\delta_{1} \theta^{\prime} W\right)-q m(W)=J(m(W))+q^{-2} m\left(\eta \delta_{1} W\right)
$$

for any paramodular vector $W$. Applying this with $W=\theta W_{0}$ we get

$$
m\left(W_{1}\right)=J\left(m\left(\theta W_{0}\right)\right)+q^{-2} m\left(\eta \delta_{1} \theta W_{0}\right) .
$$

Since $\operatorname{dim}(V(n))=1$, we have $\delta_{1} \theta W_{0}=\alpha W_{0}$ for some $\alpha \in \mathbb{C}$ (which might be zero). Hence

$$
\begin{align*}
m\left(W_{1}\right) & =J\left(m\left(\theta W_{0}\right)\right)+\alpha q^{-2} m\left(\eta W_{0}\right) \\
& =J\left(q\left[\begin{array}{c}
0 \\
\operatorname{Left}\left(s_{0}\right) \\
\operatorname{Left}\left(-q^{-2} s_{0}\right)
\end{array}\right]\right)+\alpha q^{-2} m\left(\eta W_{0}\right) \\
& =\left[\begin{array}{c}
q^{3} \operatorname{Left}\left(s_{0}\right) \\
-q \operatorname{Left}\left(s_{0}\right) \\
0
\end{array}\right]+\alpha q^{-2}\left[\begin{array}{c}
0 \\
s_{0} \\
-q^{-2} s_{0}
\end{array}\right] . \tag{7}
\end{align*}
$$

Let us now assume that $W_{0}$ does not have the asserted form; we shall derive a contradiction. Thus we assume that $n>K$, or equivalently, that $\operatorname{Left}\left(s_{0}\right) \neq 0$. Under this assumption we have $W_{1} \neq 0$. In fact, it is easy to see that the matrices given in (5), (6) and (7) are linearly independent. By Lemma 3.3 we get $\operatorname{dim}(V(n+1))=3$ and

$$
\begin{equation*}
V(n+1)=\left\langle\theta^{\prime} W_{0}, \theta W_{0}, W_{1}\right\rangle . \tag{8}
\end{equation*}
$$

Now consider the vector $W_{2}:=q \theta W_{0}-W_{1}$. The first row of $m\left(W_{2}\right)$ is given by

$$
q \operatorname{Right}\left(s_{0}\right)-q^{3} \operatorname{Left}\left(s_{0}\right)=\left(0, \ldots, 0, q^{-(n-K)+1}, 0, \ldots\right),
$$

where the non-zero entry is at position $n-K+1$ (the first entry is at position 0 ). Therefore

$$
Z\left(s, W_{2}\right)=\text { const. } \cdot\left(q^{-s}\right)^{n-K+1}
$$

By the functional equation we have

$$
Z\left(s, \pi\left(u_{n+1}\right) W\right)=q^{-(n+1) s} q^{(n+1) / 2} \gamma(1-s, \pi) Z(1-s, W)
$$

for any $W \in V(n+1)$. Applied to $W=W_{2}$ we get

$$
\begin{aligned}
Z\left(s, \pi\left(u_{n+1}\right) W_{2}\right) & =q^{-(n+1) s} q^{(n+1) / 2} \gamma(1-s, \pi) Z\left(1-s, W_{2}\right) \\
& =\text { const. } \cdot q^{-(n+1) s} \gamma(1-s, \pi)\left(q^{-(1-s)}\right)^{n-K+1} \\
& =\text { const. } \cdot q^{-(n+1) s} \gamma(1-s, \pi)\left(q^{s}\right)^{n-K+1} \\
& =\text { const. } \cdot q^{-(n+1) s} \varepsilon_{\pi} q^{-K / 2}\left(q^{-s}\right)^{-K} q^{s(n-K+1)} \\
& =\text { const. }
\end{aligned}
$$

For the fourth equality we used the fourth assertion of Theorem 3.2. Therefore, $\pi\left(u_{n+1}\right) W_{2} \in V(n+1)$ is a vector with constant zeta polynomial. On the other hand, by (8), there exist $x, y, z \in \mathbb{C}$ such that $\pi\left(u_{n+1}\right) W_{2}=x \theta^{\prime} W_{0}+y \theta W_{0}+z W_{1}$. Then

$$
Z\left(s, \pi\left(u_{n+1}\right) W_{2}\right)=x \underbrace{Z\left(s, \theta^{\prime} W_{0}\right)}_{\text {even }}+y \underbrace{Z\left(s, \theta W_{0}\right)}_{\text {odd }}+z \underbrace{Z\left(s, W_{1}\right)}_{\text {odd }} .
$$

The "even" and "odd" refer to the powers of $q^{-s}$ occuring in these zeta polynomials. Since, by (5), (6) and (7), the function $Z\left(s, \theta W_{0}\right)$ has higher degree in $q^{-s}$ than the other two zeta functions, it follows that $y=0$. Then it follows that $z=0$ since the result must be constant and $Z\left(s, W_{1}\right)$ has only odd degrees. It follows that $W_{2}=x \theta^{\prime} W_{0}$. But this is impossible since the first row of $m\left(\theta^{\prime} W_{0}\right)$ has more than one non-zero entry by our assumption.

It is evident that the claims of the theorem from the introduction follow from Theorem 3.2 and Theorem 3.4.
